Software Module of the KLIPPEL ANALYZER SYSTEM (Document Revision 2.0)

#### **FEATURES**

- Linear and nonlinear stiffness K<sub>ms</sub>(x)
- Spiders, surround, cones
- Passive radiators (drones)
- Size from 1 8 inch
- Nondestructive, dynamic method
- Fast, robust, simple handling

#### **BENEFITS**

- Specification of suspension parts
- Analysis of cause of distortion
- Defining mechanical limits
- Quality control in manufacturing
- Optimal driver design in R&D

#### **DESCRIPTION**

The SPM Pro (Suspension Part Measurement) software module and hardware accessory for the KLIPPEL R&D System is designed for the measurement of the large signal stiffness of suspension parts (spiders, surrounds, cones) and passive radiators (drones). A dynamic, nondestructive technique is used to measure the nonlinear stiffness K(x) over the full working range.

Article number 2500-102 (incl. 2500-103)

#### 1 Overview

Suspension Part Measurement

#### 1.1 **Principle**

The nonlinear stiffness K(x) and the reciprocal compliance C(x) of suspension parts (spider, surrounds, cones) and passive radiators (drones) are measured versus displacement x over the full range of operation. A dynamic, nondestructive technique is developed which measures the parts under similar condition as operated in the loudspeaker. This guarantees highest precision of the results as well as simple handling and short measurement time. Suspension parts are fixed in the measurement bench by using a set of clamping parts (rings, cones, cups) fitting to any size of circular geometries up to 222 mm diameter. The working bench excites the suspension pneumatically to vibrate at the resonance frequency related to the stiffness and the mass of the suspension and inner clamping parts. The nonlinear stiffness is calculated by the measured displacement (one-signalmethod) by using modules of the KLIPPEL Analyzer System. The measured parameter is required to specify the large signal properties of the suspension parts and to detect asymmetrical and symmetrical variations, which are the cause for instable vibration behavior and nonlinear distortion.

Additionally, the SPM Pro software includes the SPM Lite software, which calculates linear mechanical parameters of suspension parts and passive radiators (resonance frequency, Q-factor, stiffness, moving mass, mechanical resistance), accurately from the small signal displacement and sound pressure response.

The nonlinear stiffness K(x) and compliance C(x) depending on the displacement x.

## Requirements

#### **Hardware** 2.1

#### **SPM Pro Bench**

(Art. #:2500-101)

The measurement bench consists of the clamping platform mounted on a sealed enclosure of 95-liter volume and a linear, long throw 18" driver which excites the suspension pneumatically. The clamping platform holds the high-polished center rod for guiding the inner clamping parts (slide, cup, cone and nuts), the fixture for clamping the outer rim by using rings and the laser stand. The clamping platform can easily be folded up in a horizontal position for charging but is used in a vertical position during measurement. The set contains the cable for connecting the measurement bench to Klippel measurement hardware.

#### **Ring Set**

(Art. #: 2500-302)

Multiple sets of clamping rings allow the attachment of almost all suspension parts with a circular geometry between 2 and approx. 9 inch. After measuring the outer diameter and the width of the rim, the lower ring set and the upper clamping ring can be easily identified by using a table and nomenclature. The rings are made of 10 mm aluminum. Subsets of rings (to cover only selected sizes) or special forms (elliptic sizes) are available on request.

# Cup & Cone Set (metal)

(Art. #: 2500-111)

The cone is used for clamping the inner rim of the suspension part nondestructively. Multiple cones are organized in a set with a simple nomenclature to cover from 14 - 111 mm diameters. Single cones are available on request.

The counterpart of the cone is the cup which clamps the inner rim. The cups are manufactured in multiple sets to give the user full flexibility over all sizes of suspension parts. Cup Set row A, row B and row C are included in the set. Special cups can be manufactured based on customer's specification.

cups

| Measurement | Plat- |
|-------------|-------|
| form        |       |

The Distortion Analyzer 1 or 2, or the Klippel Analyzer 3 may be used as the hardware to control the laser head and to perform the measurement.

cones

cups

cups

#### Laser

A displacement laser, which is usually available as standard equipment of the KLIPPEL R&D System measures the displacement of suspension at the required precision. Due to high displacements, the sensors have to have a large linear working range. Recommended types are:

- ANR 1282 plus Controller ANR5132 (discontinued)
- LK-H082 plus Controller LK-G5001P

### **Amplifier**

A power amplifier is required for performing the measurement. The amplifier should provide more than 200 W output power at 4 Ohm.

#### Microphone (opt.)

A quarter inch microphone is required for the linear suspension parameter measurement (SPM Lite) only to measure the sound pressure in the test bench.

#### Computer

A personal computer (not available from KLIPPEL) is required for performing the measurement.

#### 2.2 Software

| dB-Lab  The Suspension part measurement also uses software modules of the KLIPPEL R& tem such as the frame software dB-Lab and the Transfer Function Module TRF |   |  |  |  |  |

## 3 Example

#### 3.1 Measurement Objects

Suspension parts (spiders, suspensions, cone with suspensions) and passive radiators of circular geometries with a diameter up to 222 mm can be measured by using the small clamping set (rings, cups, cones). For particular objects with more complicated curvatures, unusual sizes or extremely small rims special clamping parts can be manufactured on customer's request. KLIPPEL may provide service based on detailed drawings.

Although the suspension is pneumatically excited, the technique used can cope with significant air porosity of the suspension.

#### 3.2 Measurement Procedure

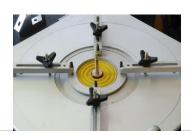

#### **Centre Clamping**

The measurement usually takes 5-10 minutes by performing the following steps:

Measure the inner and outer diameter Look at the tables to find the optimal clamping parts using the nomenclature Clamp the inner rim by using the slide, cone, cup and two nuts.

#### **Outer Clamping**

Bring the clamping platform into horizontal position for easy handling

Insert the set of lower rings into the clamping platform

Put the slide with the clamped suspension on the guiding rod

Fix the upper ring to clamp the outer rim Bring the clamping platform into vertical position

#### Measurement

Fold down the laser rack and adjust the laser head

Start the measurement which takes a few seconds

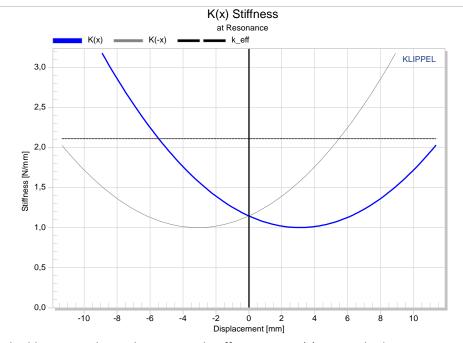

Calculate the nonlinear stiffness

Print your report by using your customized template

## 4 Output

#### 4.1 Result Curves

K(x) over Displacement

The blue curve shows the measured stiffness curve K(x) versus displacement at resonance. The effective Stiffness is visualized by the dashed line.

#### 4.2 Result Parameters

| $k_{ m eff}$ | eff Effective stiffness at resonance frequency |  |  |  |
|--------------|--|--|--|--|
| $c_{ m eff}$ | Effective compliance at resonance frequency    |  |  |  |
| $k_{04}$     | Stiffness coefficients of power series         |  |  |  |
| $W_{\rm s}$  | Mechanical Work                                |  |  |  |

### 5 Limitations

#### 5.1 Device Under Test

| Parameter                                      | Min  | Max   | Unit |
|--|------|-------|------|
| Dimension                                      |      |       |      |
| Outer Diameter                                 | 30   | 222   | mm   |
| Inner Diameter                                 | 13.9 | 110.7 | mm   |
| Resonance Frequency of DUT with Clamping Parts | 5    | 48    | Hz   |

## **6 SPM Pro Bench Specification**

- 1) Standard Ring Set
- 2) SPM Bench (with custom ring)
- 3) LST Bench

- SPM Bench
   Min. dB-Lab Release 210
   MSPM Bench requires additional equipment for laser positioning (SCN Vibrometer, LST-Bench or Pro-Stand)
   For DUTs with Ø >= 222 mm / <= 490 mm, customized clamping rings required</li>
- 8) MSPM Bench
